

## 13.0 Server software

---

### 13.1 Version control

Version 1.0 - 9 February 2021 - first version

---

### 13.2 Introduction

This document describes the server software of the DMO. It is the simulation software where you can enter a date for your DMO.

---

### 13.3 Git

The server software can be found at <https://github.com/demoor-orrery/DMO/>

---

### 13.4 General instructions

It is a zipped file, so unpack it and install it in the root of your webserver.

It is a copy from <https://github.com/mgvez/jsorrery> with an added “save positions” button to it which publishes the string the DMO needs to get into constellation.

You can install it on any server on the internet but you can also install your own server and hook that server up to your local Wifi-network. With the first solution you reach to the JsOrrery via a domain name and with the other directly to your IP address.
